PerformanceVector:
root_mean_squared_error: 101108.812 +/- 0.000
relative_error: 7.62% +/- 9.36%
correlation: 0.958

Conclusion

The evaluation metrics demonstrate that the model possesses great predictive capability for housing prices. Its most notable strength is a remarkably high correlation of 0.958, indicating a near-perfect linear relationship where the model consistently and accurately scales its estimates in sync with true property values. While the Root Mean Squared Error (RMSE) shows an average raw deviation of \$101,108.81, the relative error provides a much more practical perspective on its performance: on average, the model's predictions are only 7.62% away from the actual home price. Although the relative error's standard deviation of 9.36% means individual predictions will experience some expected fluctuation—typically staying within a 17% variance—the combination of high correlation and low overall error confirms that this is a highly dependable and accurate tool for real estate valuation.
